Things I love to do.

Methodologies I frequently follow.

Platforms/Technologies of Interest

CASE STUDY 1:

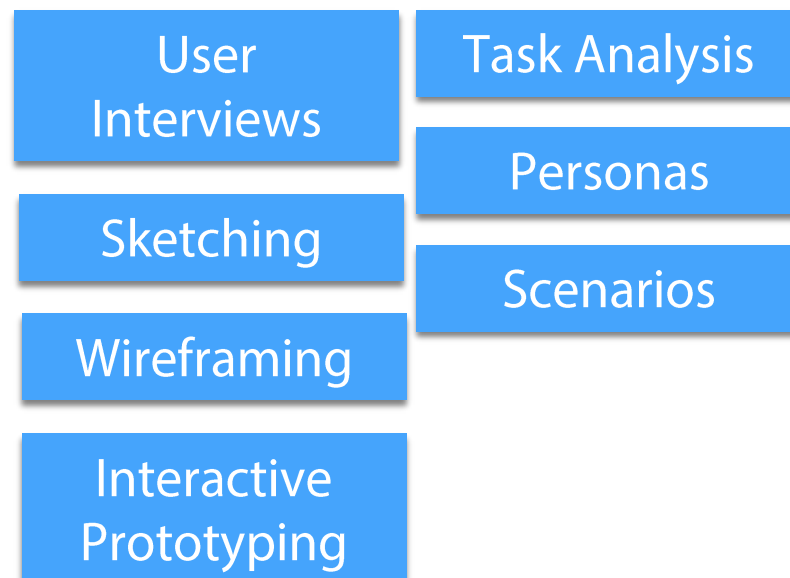

Easy Meetings

Overview:

Creating meeting is a hectic task because when attendees are spanning over geographies

The goal was to design a system which solves problems of the current meeting scheduler system of the organization.

Responsibilities:

Process:

The team went through thorough evaluation of current tool in place. With the help of Contextual Enquiries and User Interviews team discovered the problem needs to be addressed.

The decision is made to make a mobile application to schedule meetings based on feedback.

Early sketching and valuation of paper prototypes were used to get user feedback.

Task Analysis Grid

Task Analysis Grid*				
Sub-task:	Receiving request for scheduling meeting	Selecting Participants	Selecting Date, Time and Location	Getting notified
Scenario:	Neeta receives requests for scheduling a meeting from either the CEO or members of the senior management who want to meet to CEO.	User needs to select participants for meeting. Participants are spread across different geographies.	User needs to select date and time and location of meeting.	Participants get notified on schedule
Applies to:	Neeta	Jeevan and Neeta	Jeevan and Neeta	Jeevan, Neeta
Influencers:	Number of meeting requests. Priority of requests.	Number of participants. Geographies of participants.	Geography of participants, Time and duration of meeting. Availability of participants. Availability of meeting room.	Time and duration of meeting. Whether participants are available.
Pain points:	Scheduling received meeting requests with proper details	Select proper participants	Checking availability of participants. Find suitable time since participants spread across different	Getting notified. Getting notified at different times.

I have split the questions in to three categories:

(1 and 2) To find the difficulties or shortcoming of existing platform

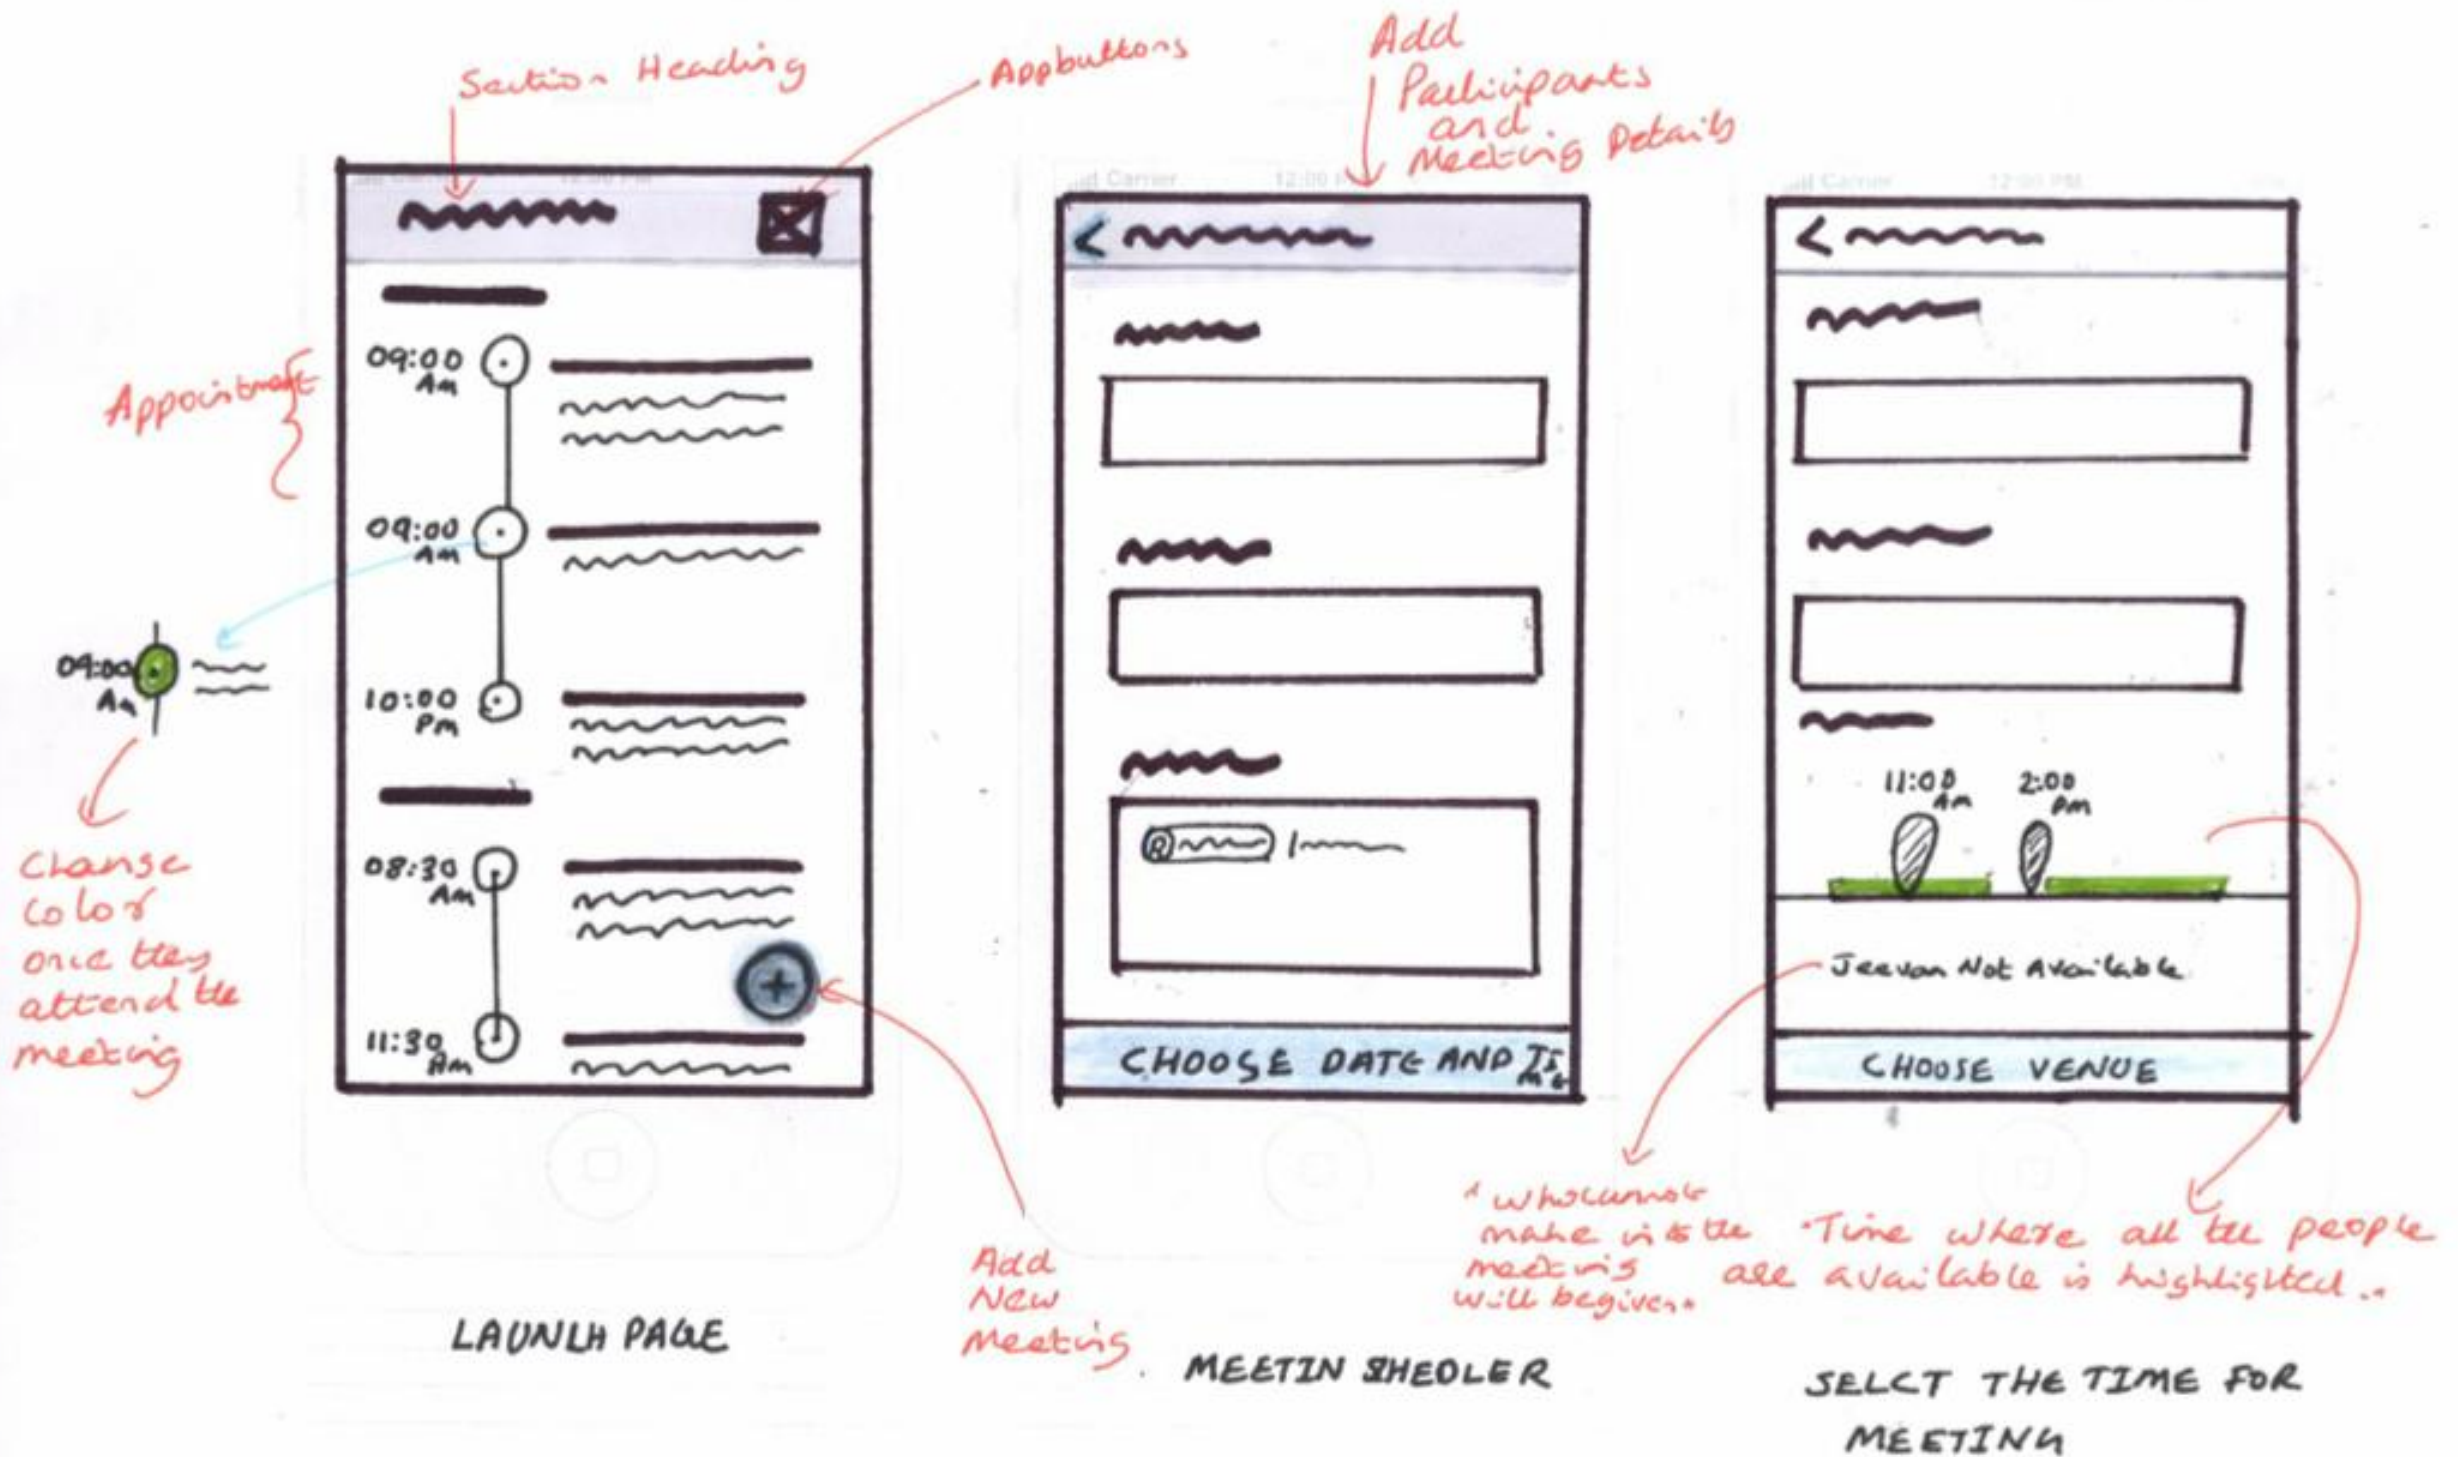

(3 to 13) To find the difficulties regarding scheduling the meeting

(14 to 16) To find the difficulties on getting notified about meeting

Few of user Interview Questions

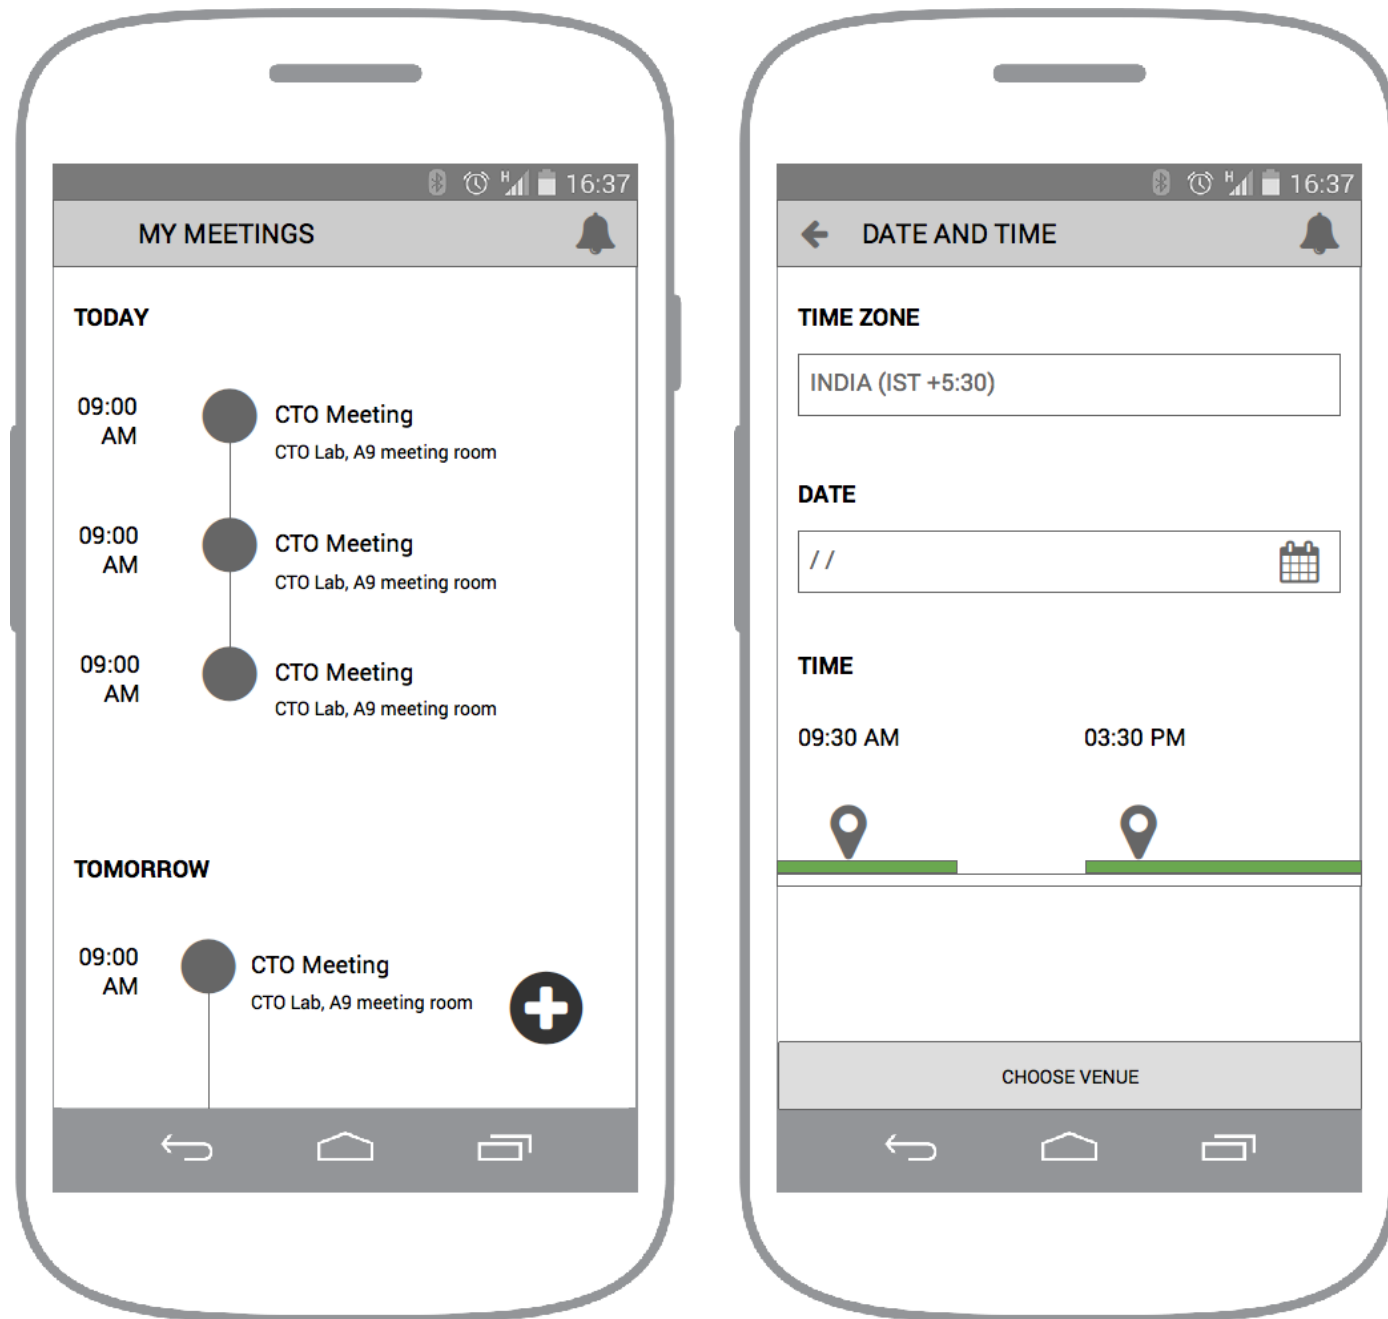

1. What are all the difficulties with existing system in scheduling meetings?
2. How effective the system you are currently using?
3. How often you schedule the meetings?
4. On average how many meeting you schedule or attend?
5. How do you confirm the availability of participants before scheduling meeting?
6. Can you explain me the process of scheduling the meeting?
7. What are all the approvals required on scheduling?
8. What will you do if some participants are unavailable?
9. How do you select the meeting place or location? Ex. Place, Office, Conference Room etc.
10. How often you travel across geographies?
11. How do you schedule meetings on the go?

Few of the sketches

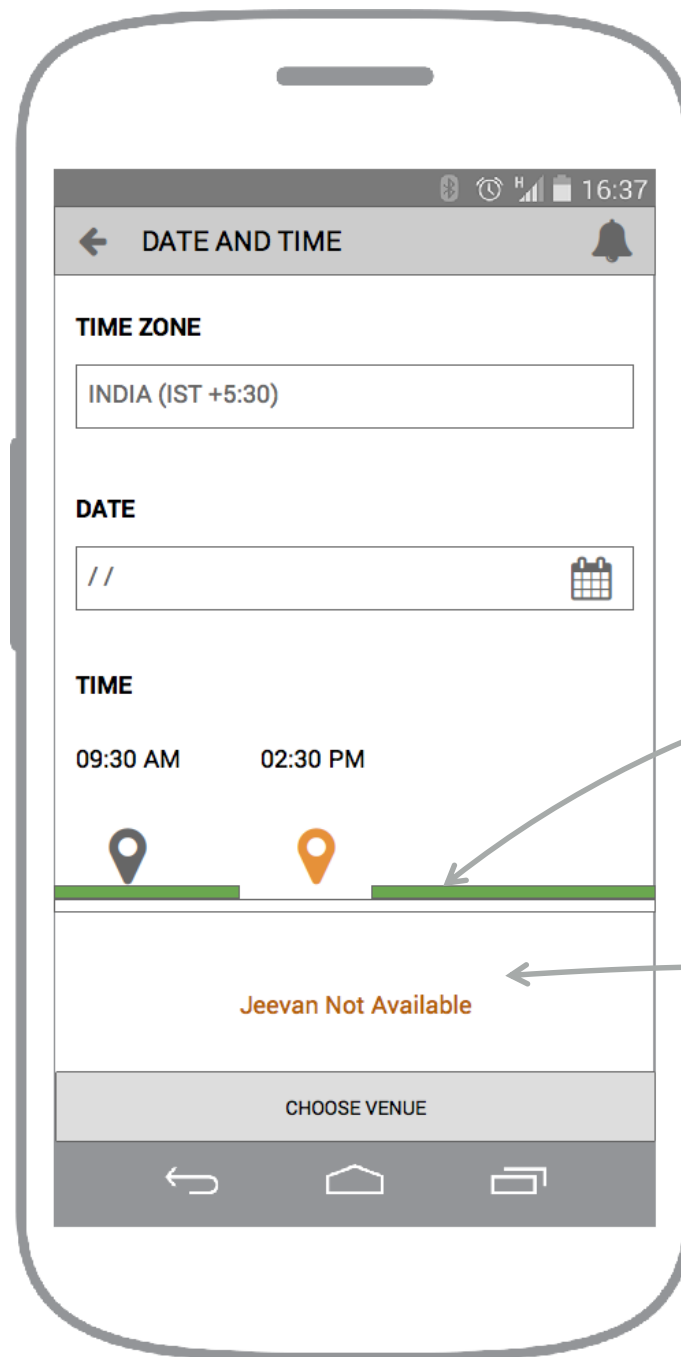

Refinements are made based on paper prototypes.
As next step, digital interactive prototypes were made and it again tested with users.

*Screens used for
interactive prototyping*

Primary focus was on easy and usable interaction patterns that makes the booking process hassle free.

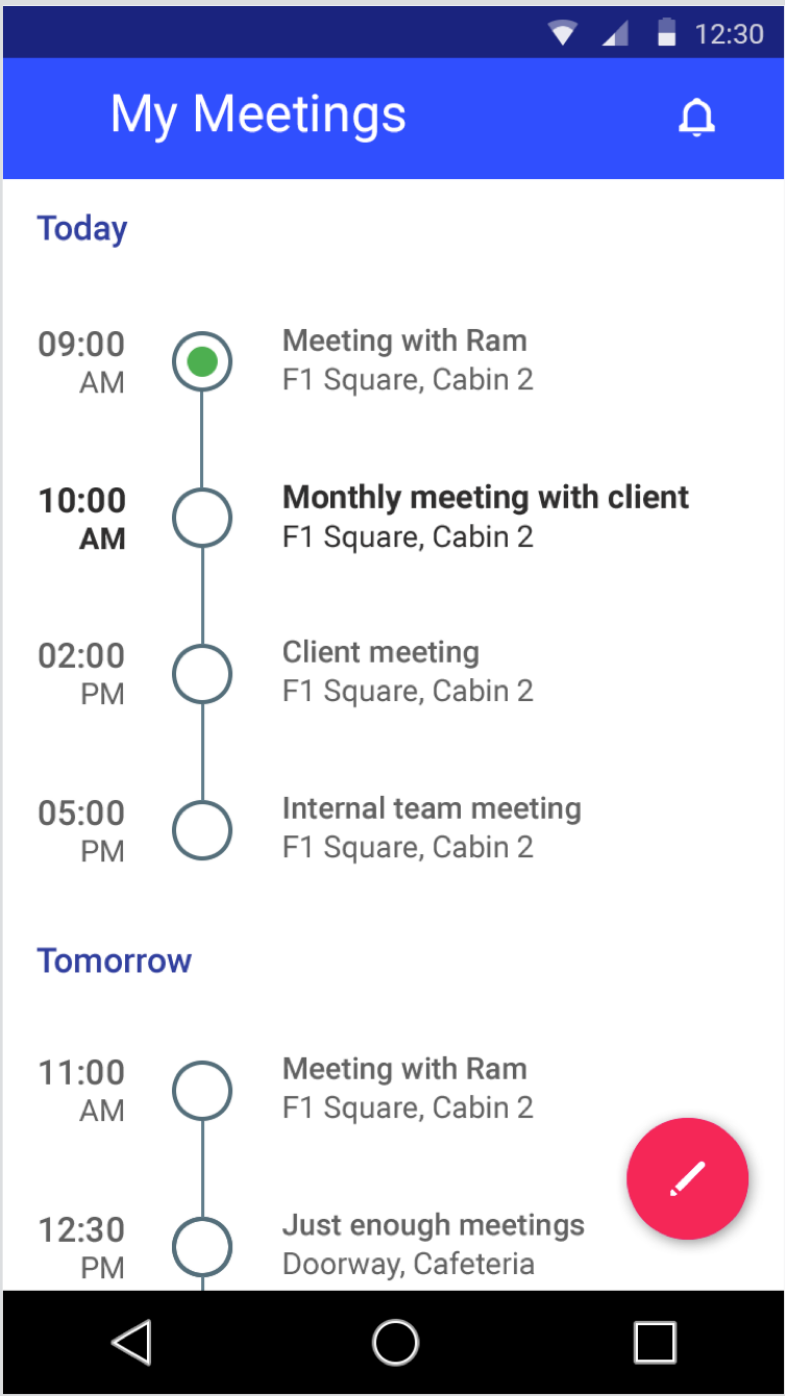

one of the interactions designed

Based on availability of attendees, time line is highlighted.

Instant feedback is given if the user is going to schedule a meeting with an attendee who is not free that time

*Home screen of the
application in production*

CASE STUDY 2:

abdulraoof.com

Overview:

This is my personal website. The approach was to design it primarily for mobile devices. So I followed the *Mobile First* approach. Responsive web design is followed to assure hassle free rendering of the site on multiple devices.

To avoid complexities related to creating a blog authoring platform I chose Jekyll, a static site generator from Github. So that only front end development is needed.

Responsibilities:

User
Interviews

Sketching

Wireframing

Interactive
Prototyping

Development

Process:

The process started with user research. Which helped to get insights regarding motivations behind following blogs and websites by individuals.

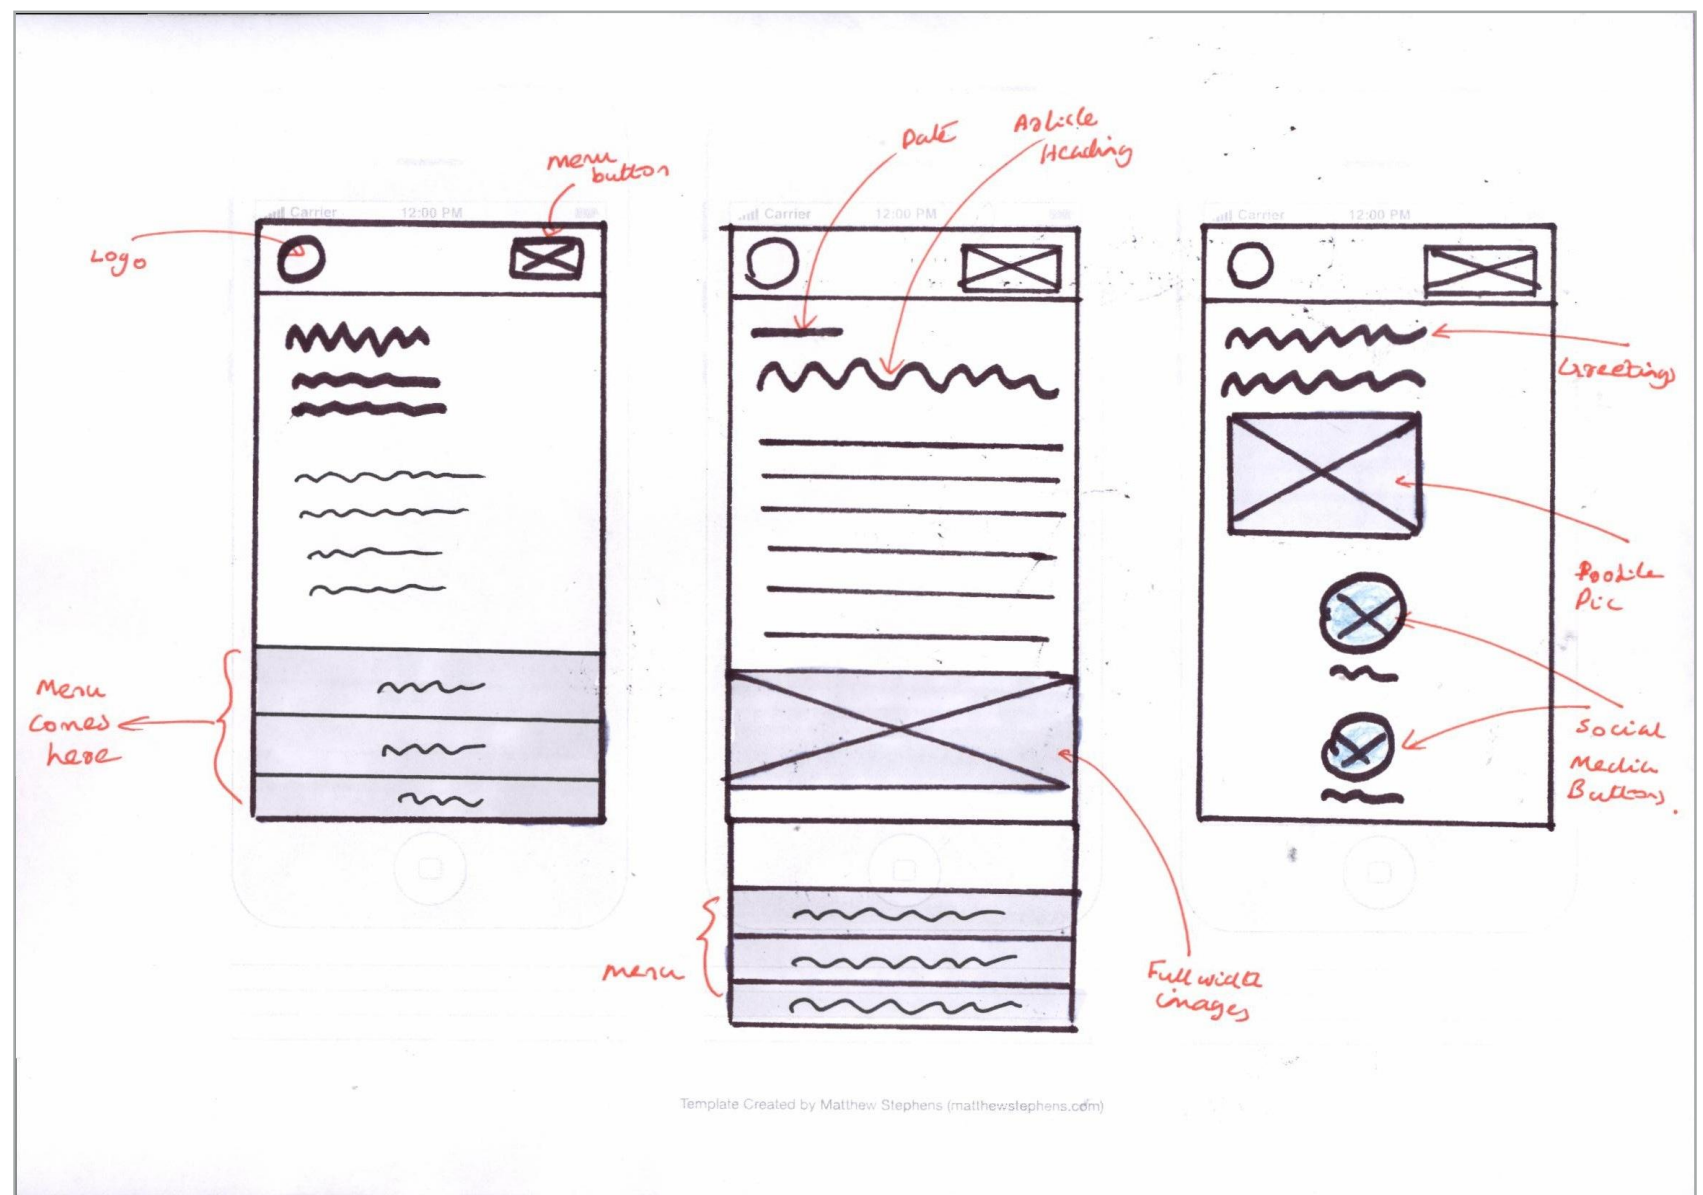

At this stage the IA of the site also finalized. The site contains the following.

- Writings - collection of articles wrote by me
- Collection - collection of interesting found objects
- About - way of contact

After that process went through sketching. Primary focus were on navigation.

Numerous prototypes were created to test different navigation patterns. *Flinto* was the prototyping tool of choice because of its simplicity and simple nature of the project.

Few of the early sketches

Sketching for Tablet(right)
and Desktop(below)

The prototype tested with people to collect feedback, based on that refinements are made.

DESIGNER'S MIND

How people are coming up with ideas? Somehow, from some where they are getting the spark. But the conscious pickup of concepts, contexts, knowledge or experience affect the unconscious decisions we make every day.

Design decisions made by a designer largely depends on constraints. As designer grasp more constraints affecting the design problem, the design decisions becomes more effective (of course skill of the designer is a major factor).
